Subband processing

15: Subband Processing

• Subband processing

- 2-band Filterbank
- Perfect Reconstruction
- Quadrature Mirror Filterbank (QMF)
- Polyphase QMF
- QMF Options
- Linear Phase QMF
- IIR Allpass QMF
- Tree-structured filterbanks
- Summary

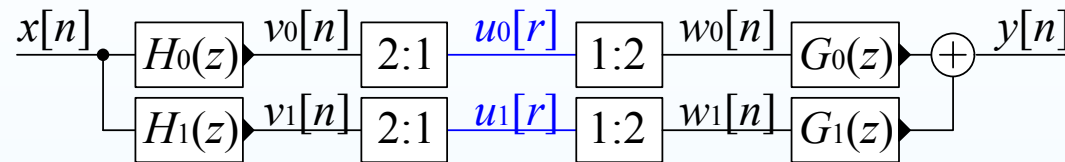

- The $H_m(z)$ are bandpass *analysis filters* and divide $x[n]$ into frequency bands
- Subband processing often processes frequency bands independently
- The $G_m(z)$ are *synthesis filters* and together reconstruct the output
- The $H_m(z)$ outputs are *bandlimited* and so *can be subsampled without loss of information*
 - Sample rate multiplied overall by $\sum \frac{1}{P_i}$
 - $\sum \frac{1}{P_i} = 1 \Rightarrow$ *critically sampled*: good for coding
 - $\sum \frac{1}{P_i} > 1 \Rightarrow$ *oversampled*: more flexible
- Goals:
 - good frequency selectivity in $H_m(z)$
 - perfect reconstruction*: $y[n] = x[n - d]$ if no processing
- Benefits: Lower computation, faster convergence if adaptive

2-band Filterbank

15: Subband Processing

- Subband processing
- **2-band Filterbank**
- Perfect Reconstruction
- Quadrature Mirror Filterbank (QMF)
- Polyphase QMF
- QMF Options
- Linear Phase QMF
- IIR Allpass QMF
- Tree-structured filterbanks
- Summary

$$V_m(z) = H_m(z)X(z) \quad [m \in \{0, 1\}]$$

$$U_m(z) = \frac{1}{K} \sum_{k=0}^{K-1} V_m(e^{-j\frac{2\pi k}{K}} z^{\frac{1}{K}}) = \frac{1}{2} \left\{ V_m\left(z^{\frac{1}{2}}\right) + V_m\left(-z^{\frac{1}{2}}\right) \right\}$$

$$W_m(z) = U_m(z^2) = \frac{1}{2} \{V_m(z) + V_m(-z)\} \quad [K = 2]$$

$$= \frac{1}{2} \{H_m(z)X(z) + H_m(-z)X(-z)\}$$

$$\chi(-z) = \chi(e^{j\omega})$$

$$= \chi(e^{j\omega - \pi})$$

aliasing: shifted by π

$$Y(z) = \begin{bmatrix} W_0(z) & W_1(z) \end{bmatrix} \begin{bmatrix} G_0(z) \\ G_1(z) \end{bmatrix}$$

$$= \frac{1}{2} \begin{bmatrix} X(z) & \underbrace{X(-z)}_{\text{aliasing}} \end{bmatrix} \begin{bmatrix} H_0(z) & H_1(z) \\ H_0(-z) & H_1(-z) \end{bmatrix} \begin{bmatrix} G_0(z) \\ G_1(z) \end{bmatrix}$$

$$= \begin{bmatrix} X(z) & X(-z) \end{bmatrix} \begin{bmatrix} T(z) \\ A(z) \end{bmatrix}$$

$[X(-z)A(z)]$ is "aliased" term

We want (a) $T(z) = \frac{1}{2} \{H_0(z)G_0(z) + H_1(z)G_1(z)\} = z^{-d}$

and (b) $A(z) = \frac{1}{2} \{H_0(-z)G_0(z) + H_1(-z)G_1(z)\} = 0$

Perfect Reconstruction

15: Subband Processing

- Subband processing
- 2-band Filterbank
- **Perfect Reconstruction**
- Quadrature Mirror Filterbank (QMF)
- Polyphase QMF
- QMF Options
- Linear Phase QMF
- IIR Allpass QMF
- Tree-structured filterbanks
- Summary

For perfect reconstruction without aliasing, we require

$$\frac{1}{2} \begin{bmatrix} H_0(z) & H_1(z) \\ H_0(-z) & H_1(-z) \end{bmatrix} \begin{bmatrix} G_0(z) \\ G_1(z) \end{bmatrix} = \begin{bmatrix} z^{-d} \\ 0 \end{bmatrix}$$

Hence:
$$\begin{bmatrix} G_0(z) \\ G_1(z) \end{bmatrix} = \begin{bmatrix} H_0(z) & H_1(z) \\ H_0(-z) & H_1(-z) \end{bmatrix}^{-1} \begin{bmatrix} 2z^{-d} \\ 0 \end{bmatrix}$$

$$= \frac{2z^{-d}}{H_0(z)H_1(-z) - H_0(-z)H_1(z)} \begin{bmatrix} H_1(-z) & -H_1(z) \\ -H_0(-z) & H_0(z) \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix}$$

$$= \frac{2z^{-d}}{H_0(z)H_1(-z) - H_0(-z)H_1(z)} \begin{bmatrix} H_1(-z) \\ -H_0(-z) \end{bmatrix}$$

$\frac{2}{c}$: compensate
downsample/upsample
scaling

For all filters to be FIR, we need the denominator to be

$$H_0(z)H_1(-z) - H_0(-z)H_1(z) = cz^{-k}, \text{ which implies}$$

c : scale factor

$$\begin{bmatrix} G_0(z) \\ G_1(z) \end{bmatrix} = \frac{2}{c} z^{k-d} \begin{bmatrix} H_1(-z) \\ -H_0(-z) \end{bmatrix} \stackrel{d=k}{=} \frac{2}{c} \begin{bmatrix} H_1(-z) \\ -H_0(-z) \end{bmatrix}$$

Note: c just scales $H_i(z)$ by $c^{\frac{1}{2}}$ and $G_i(z)$ by $c^{-\frac{1}{2}}$.

- Summary

Quadrature Mirror Filterbank (QMF)

$L \rightarrow H \rightarrow L$: $\text{coef} * (-1)^n$

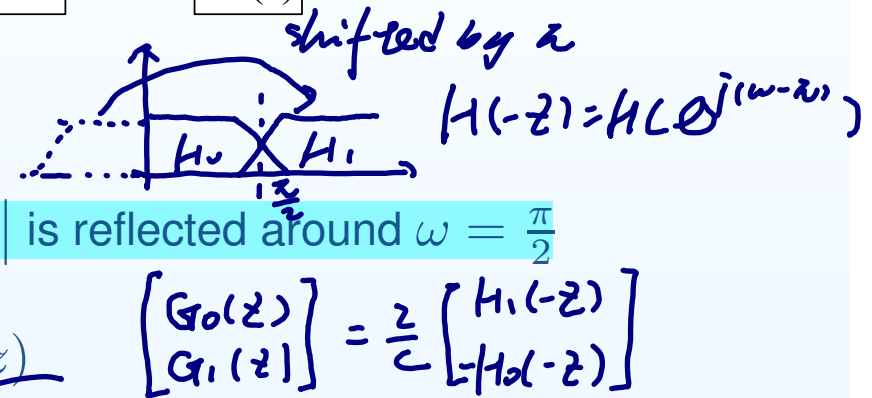

QMF satisfies:

(a) $H_0(z)$ is causal and real

(b) $H_1(z) = H_0(-z)$: i.e. $|H_0(e^{j\omega})|$ is reflected around $\omega = \frac{\pi}{2}$

(c) $G_0(z) = 2H_1(-z) = 2H_0(z)$

(d) $G_1(z) = -2H_0(-z) = -2H_1(z)$

QMF is alias-free:

$$A(z) = \frac{1}{2} \{H_0(-z)G_0(z) + H_1(-z)G_1(z)\}$$

$$= \frac{1}{2} \{2H_1(z)H_0(z) - 2H_0(z)H_1(z)\} = 0$$

QMF Transfer Function:

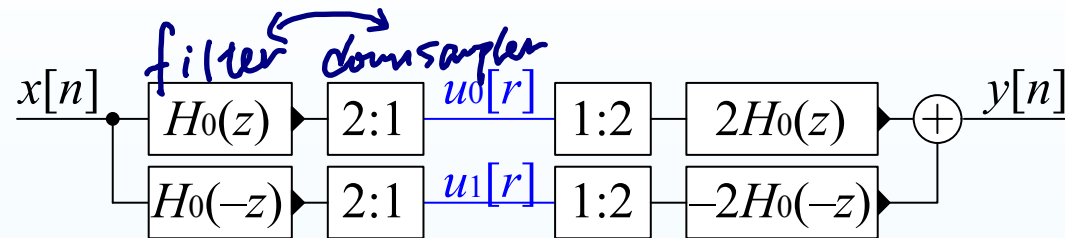

$$T(z) = \frac{1}{2} \{H_0(z)G_0(z) + H_1(z)G_1(z)\}$$

$$= H_0^2(z) - H_1^2(z) = H_0^2(z) - H_0^2(-z)$$

Polyphase QMF

15: Subband Processing

- Subband processing
- 2-band Filterbank
- Perfect Reconstruction
- Quadrature Mirror Filterbank (QMF)
- **Polyphase QMF**
- QMF Options
- Linear Phase QMF
- IIR Allpass QMF
- Tree-structured filterbanks
- Summary

Polyphase decomposition:

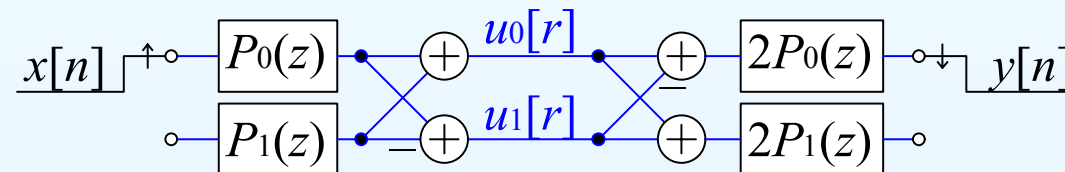

$$H_0(z) = P_0(z^2) \oplus z^{-1} P_1(z^2)$$

$$H_1(z) = H_0(-z) = P_0(z^2) \ominus z^{-1} P_1(z^2)$$

$$G_0(z) = 2H_0(z) = \oplus 2P_0(z^2) + 2z^{-1} P_1(z^2)$$

$$G_1(z) = -2H_0(-z) = \ominus 2P_0(z^2) + 2z^{-1} P_1(z^2)$$

only need calculate coef of H, G once
(H, G : different input.
need separate calculation)

Transfer Function: $T(z) = H_0^2(z) - H_1^2(z) = 4z^{-1} P_0(z^2) P_1(z^2) = z^{-d}$

$$T(z) = H_0^2(z) - H_1^2(z) = 4z^{-1} P_0(z^2) P_1(z^2)$$

$$\text{we want } T(z) = z^{-d} \Rightarrow P_0(z^2) = a_0 z^{-k}, P_1(z^2) = a_1 z^{k+1-d}$$

$\Rightarrow H_0(z)$ has only two non-zero taps \Rightarrow poor freq selectivity

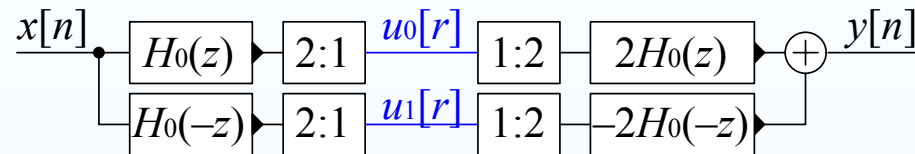

\therefore **Perfect reconstruction QMF filterbanks cannot have good freq selectivity**

perfect reconstruction
is
freq. selectivity

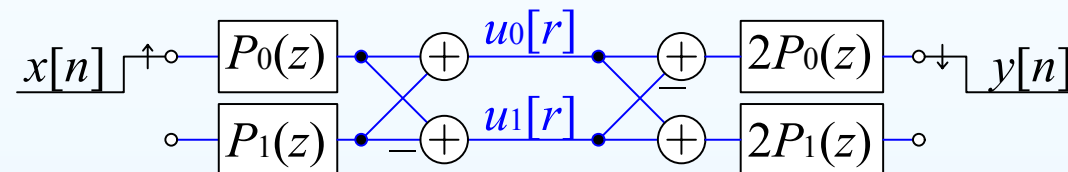

QMF Options

- Perfect Reconstruction
- Quadrature Mirror Filterbank (QMF)
- Polyphase QMF
- **QMF Options**
- Linear Phase QMF
- IIR Allpass QMF
- Tree-structured filterbanks
- Summary

Polyphase decomposition:

$A(z) = 0 \Rightarrow$ no alias term

$$T(z) = H_0^2(z) - H_1^2(z) = H_0^2(z) - H_0^2(-z) = 4z^{-1}P_0(z^2)P_1(z^2)$$

Options:

(A) **Perfect Reconstruction:** $T(z) = z^{-d} \Rightarrow H_0(z)$ is a bad filter.

(B) $T(z)$ is **Linear Phase FIR:**

\Rightarrow Tradeoff: $|T(e^{j\omega})| \approx 1$ versus $H_0(z)$ stopband attenuation

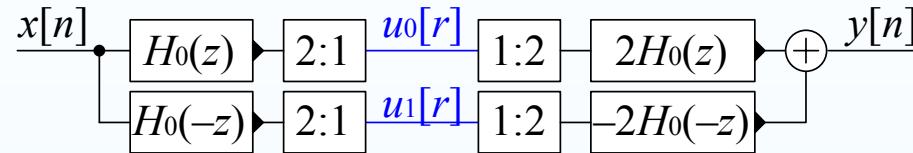

(C) $T(z)$ is **Allpass IIR:** $H_0(z)$ can be Butterworth or Elliptic filter

\Rightarrow Tradeoff: $\angle T(e^{j\omega}) \approx \tau\omega$ versus $H_0(z)$ stopband attenuation

Option (B): Linear Phase QMF

15: Subband Processing

- Tree-structured filterbanks
- Summary

$$T(z) \approx 1$$

$$H_0(z) \text{ order } M, \text{ linear phase} \Rightarrow H_0(e^{j\omega}) = \pm e^{-j\omega \frac{M}{2}} |H_0(e^{j\omega})|$$

$$\begin{aligned} T(e^{j\omega}) &= H_0^2(e^{j\omega}) - H_1^2(e^{j\omega}) = H_0^2(e^{j\omega}) - H_0^2(-e^{j\omega}) \\ &= e^{-j\omega M} |H_0(e^{j\omega})|^2 - e^{-j(\omega-\pi)M} |H_0(e^{j(\omega-\pi)})|^2 \\ &= e^{-j\omega M} \left(|H_0(e^{j\omega})|^2 - (-1)^M |H_0(e^{j(\pi-\omega)})|^2 \right) \end{aligned}$$

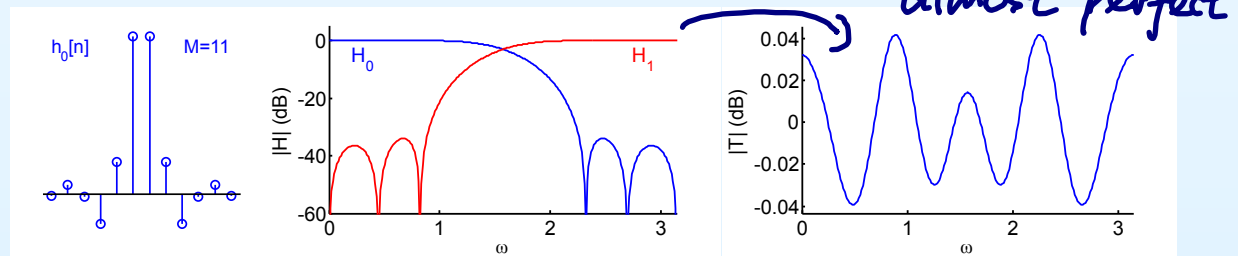

$$M \text{ even} \Rightarrow T(e^{j\frac{\pi}{2}}) = 0 \text{ 😞 so choose } M \text{ odd} \Rightarrow -(-1)^M = +1$$

Select $h_0[n]$ by numerical iteration to minimize

$$\alpha \int_{\frac{\pi}{2}+\Delta}^{\pi} |H_0(e^{j\omega})|^2 d\omega + (1-\alpha) \int_0^{\pi} (|T(e^{j\omega})| - 1)^2 d\omega$$

$\alpha \rightarrow$ balance between $H_0(z)$ being lowpass and $T(e^{j\omega}) \approx 1$

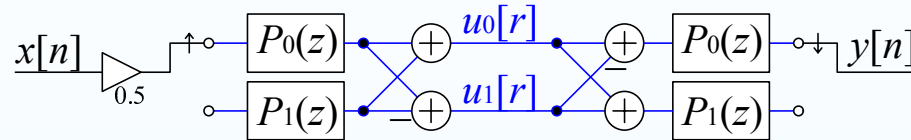

Johnston filter
($M = 11$):

Option (C): IIR Allpass QMF

15: Subband Processing

- Subband processing
- 2-band Filterbank
- Perfect Reconstruction
- Quadrature Mirror Filterbank (QMF)
- Polyphase QMF
- QMF Options
- Linear Phase QMF
- IIR Allpass QMF
- Tree-structured filterbanks
- Summary

$$|T(z)| = 1$$

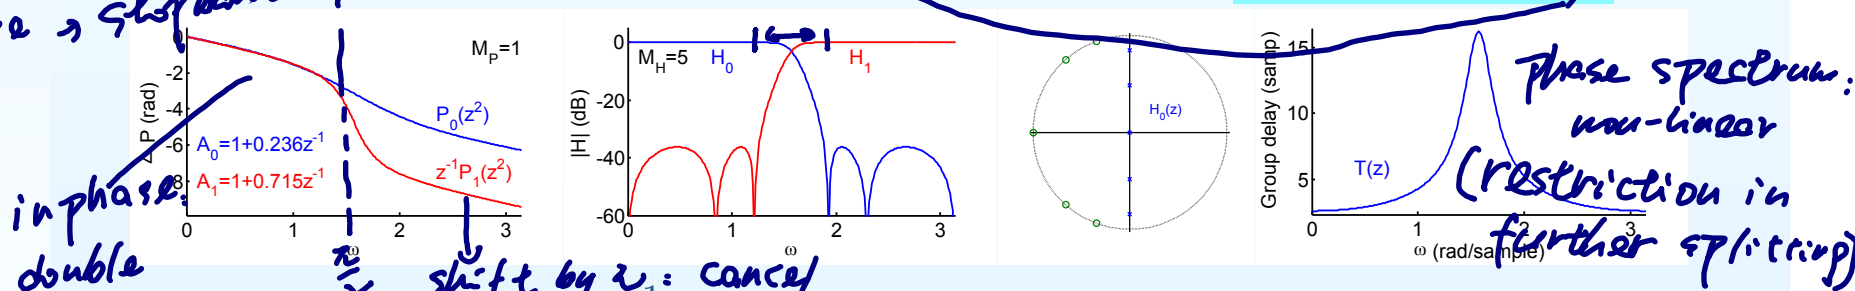

Choose $P_0(z)$ and $P_1(z)$ to be allpass IIR filters:

$$H_{0,1}(z) = \frac{1}{2} (P_0(z^2) \pm z^{-1}P_1(z^2)), \quad G_{0,1}(z) = \pm 2H_{0,1}(z)$$

$A(z) = 0 \Rightarrow$ No aliasing

$T(z) = H_0^2 - H_1^2 = \dots = z^{-1}P_0(z^2)P_1(z^2)$ is an allpass filter.

$H_0(z)$ can be made a Butterworth or Elliptic filter with $M_H = 4M_P + 1$:

Phase cancellation: $\angle z^{-1}P_1 = \angle P_0 + \pi$; Ripples in H_0 and H_1 cancel.

phase transition: narrower transition band

perfect but nonlinear.

Phase:
in phase \rightarrow passband
out of phase \rightarrow stopband
by z
in phase double

shift by z : cancel

phase spectrum:
non-linear
(restriction in further splitting)

Tree-structured filterbanks

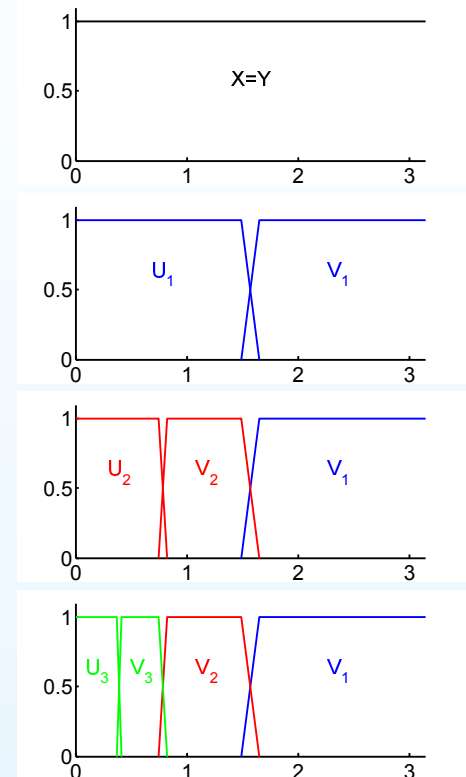

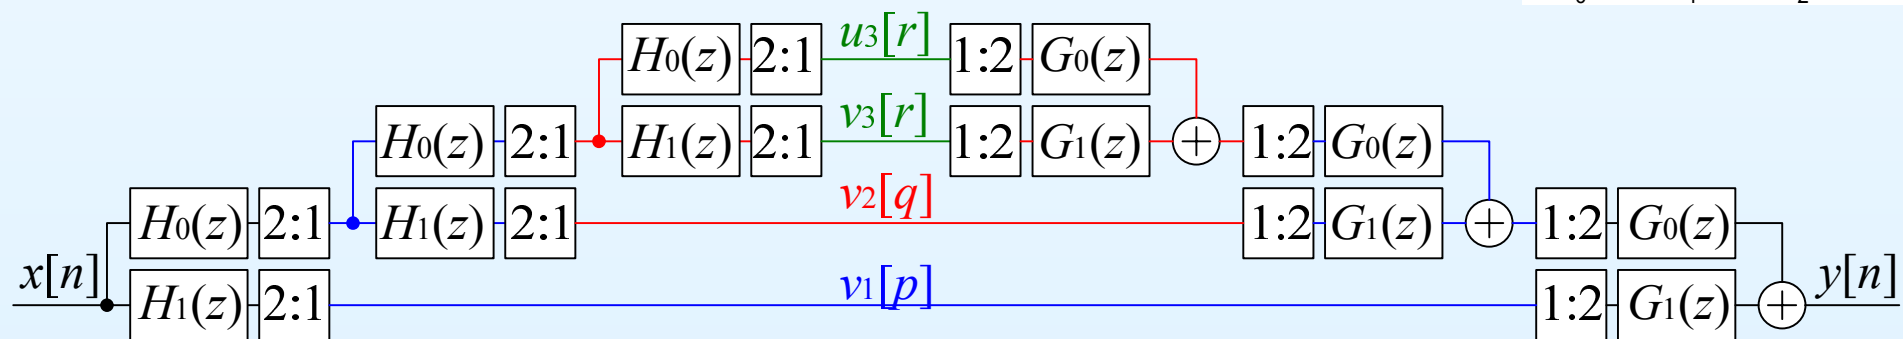

A *half-band filterbank* divides the full band into two equal halves.

You can repeat the process on either or both of the signals $u_1[p]$ and $v_1[p]$.

Dividing the lower band in half repeatedly results in an *octave band filterbank*. Each subband occupies one octave (= a factor of 2 in frequency) except the first subband.

The properties “perfect reconstruction” and “allpass” are preserved by the iteration.

iterate in tree structure

15: Subband Processing

- Subband processing
- 2-band Filterbank
- Perfect Reconstruction
- Quadrature Mirror Filterbank (QMF)
- Polyphase QMF
- QMF Options
- Linear Phase QMF
- IIR Allpass QMF
- Tree-structured filterbanks
- **Summary**

Summary

- **Half-band filterbank:**
 - Reconstructed output is $T(z)X(z) + A(z)X(-z)$
 - Unwanted alias term is $A(z)X(-z)$
- **Perfect reconstruction:** imposes strong constraints on analysis filters $H_i(z)$ and synthesis filters $G_i(z)$.
- **Quadrature Mirror Filterbank (QMF)** adds an additional symmetry constraint $H_1(z) = H_0(-z)$.
 - Perfect reconstruction now impossible except for trivial case.
 - Neat polyphase implementation with $A(z) = 0$
 - Johnston filters: Linear phase with $T(z) \approx 1$
 - Allpass filters: Elliptic or Butterworth with $|T(z)| = 1$
- Can iterate to form a tree structure with equal or unequal bandwidths.

See Mitra chapter 14 (which also includes some perfect reconstruction designs).
