b) i) Note that the transfer function is
$$H(Z) = \frac{1}{1 - \alpha Z^{-1}} = \sum_{n=0}^{\infty} \alpha^n Z^{-n}$$

So
$$h(n) = d^n \qquad n \neq 0$$
 [2B]

Therefore,

$$R_{y}(n) = R_{x}(n) \otimes h(-n) \otimes h(n)$$

$$= h(-n) \otimes h(n)$$
[2B]

Since Rx(n) = (a).

$$R_{y(n)} = \begin{cases} \sum_{k=0}^{\infty} \alpha^{-(n-k)} \alpha^{k} & n < 0 \\ \sum_{k=n}^{\infty} \alpha^{-(n-k)} \alpha^{k} & n > 0 \end{cases}$$

$$= \begin{cases} d^{n} \sum_{k=0}^{\infty} d^{2k} & n > 0 \end{cases}$$

$$= \begin{cases} d^{-n} \frac{1}{1-\alpha^2} & n < 0 \\ \alpha^n \frac{1}{1-\alpha^2} & n > 0 \end{cases}$$
